

Cannabinoids tied to mineral necessities of daily suggested value:

THC (Tetrahydrocannabinol) – *within milky white trichomes before the plant begins to mature at the feature. The development of this visibly observable feature of color is present by the plant during mid-flowering weeks, weeks 3-6 to be specific.*

- Nitrogen
- Potassium
- Phosphorous
- Magnesium
- Calcium
- Sulfur

CBD (Cannabidiol) – *within both milky white and amber trichomes with a diverse range of THC and CBN levels in the trichome array found in the stages of development with the plant. The visibly observable array of both milky white trichomes and amber brown trichomes occurs between 3 and 7 weeks of plant flower maturity to be beyond the clear, glass-like early flowering stage.*

- Iron
- Manganese
- Zinc
- Boron
- Copper

CBN (Cannabinol) – *within red and amber trichomes after the plant has matured and degraded the THC that was once present. The amber red and brown arrays of trichome color appear in the late flowering stage of the plant, which are occurring after 7 weeks of plant flowering development.*

- Iron
- Manganese
- Zinc
- Boron
- Copper
